

Task – 5

3 Problems in C Version and How OOP Solved Them

1. Data and functions were separate

- In C, task data and functions were separate.
- In OOP, Task class keeps **data and methods together**.

2. Managing multiple tasks was difficult

- In C, we had to manage arrays and indexes manually.
- In OOP, TaskList class manages multiple Task objects using methods like addTask() and showTasks().

3. Marking a task as done was less organized

- In C, we had to directly change the array value.
- In OOP, we simply use markDone() method to change the task status.

In short: OOP makes the program more **organized, reusable, and easier to manage**.
