

## 1. Encapsulation

- Encapsulation means **keeping data private and allowing access through methods.**
- **Instagram example:**  
Your account password is private. You cannot directly access Instagram's stored password. You use methods like **login** or **change password** to work with it.

## 2. Abstraction

- Abstraction means **hiding complex internal work and showing only what the user needs.**
- **Instagram example:**  
When you upload a photo, you simply click **Post**. You don't need to know how Instagram compresses the image, stores it on servers, or sends it to followers.
